Chapter 5

More Data Types and operators

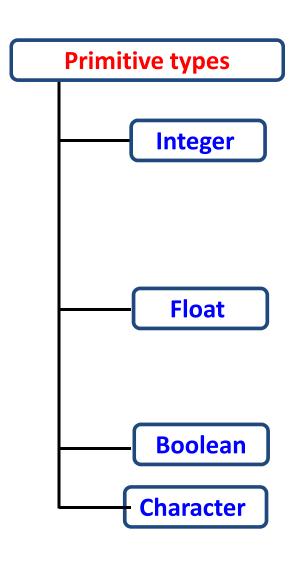

More Data Types and Operators

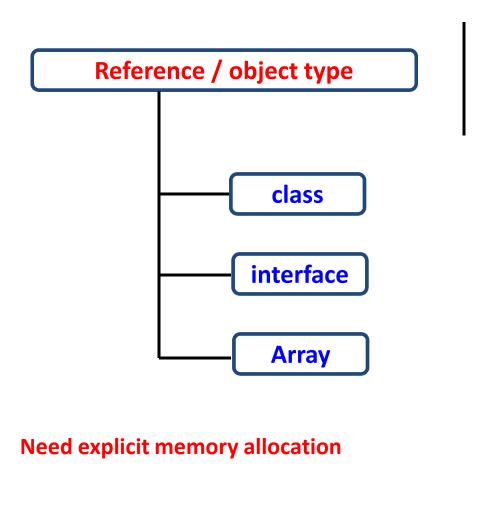

- Arrays
- Multidimensional Arrays
- Alternative Array Declaration Syntax
- Assigning Array References
- Using the Length Member
- The For-Each Style for Loop
- Strings
- The Bitwise operators.

INTRODUCTION

- Arrays
 - 1. Syntax, memory allocation
 - 2.one-dimentional and Multi-dimentional array
 - 3. Using the length member
 - 4.for-each loop
 - 5. Jagged Arrays

Data types revisited

1. Syntax

Array

A structure that holds multiple values of the same type.

Features

Array is an object

1. Syntax

```
    Creating reference of array
    <a href="Datatype">Datatype</a> [] <a href="referenceName">referenceName</a>;
```

□ Example:

```
int [] price; // java style

Has No Memory

float salary []; // C style
```

1. Syntax

- Allocating Memory to array
 - new keyword allocates memory for array

```
□ Example:
```

```
int [ ] price = new int [10]; // Initializing memory

float [ ] salary; // No memory

salary = new float[6]; // Assigning memory
```

Exceptions in Array

Legal indexes:

between 0 and the array's length – 1

Example

```
int [] data = new int [10];

System.out.println( data[0] );  // okay
System.out.println( data[9] );  // okay
System.out.println( data[-1] );  // exception
System.out.println( data[10] );  // exception
ArrayIndexOutOfBoundsException
```

for loop with Array

Initialization

```
int [ ] arr = { 10, 20, 30 };
```

for loop

```
for ( int m=0; m<3; m++ )
System.out.println(arr[m]);</pre>
```

for loop with Array

Initialization

```
int [ ] arr = { 10, 20, 30 };
```

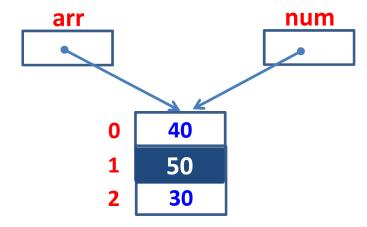

Using Array member: length

```
for ( int m=0; m<arr.length; m++ )
System.out.println( arr[m] );</pre>
```

Array copy...

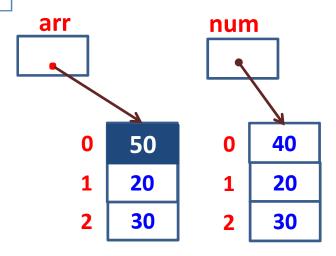

```
int arr [] = {40, 20, 30};
int num[] = arr;
arr[1] = 50;
System.out.println( "arr[1] = " + arr[1] );
System.out.println( "num[1] = " + num[1] );
```

• Example

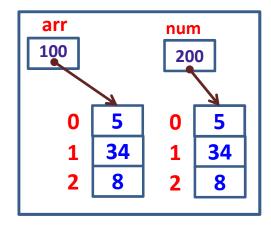

Using clone() method of array

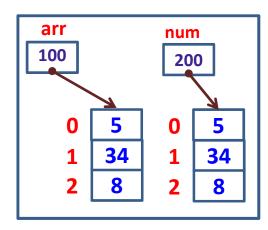

```
int arr [] = {40, 20, 30};
int num[] = arr.clone();
arr[0] = 50;
System.out.println( "arr[0] = " + arr[0] );
System.out.println( "num[0] = " + num[0] );
```

Testing for equality...

Using Arrays class...

Default Initial Values

 When an array is instantiated, default values of singledimensional arrays are

Array data type	Default value
byte, short, int, long	0
float, double	0.0
char	space
boolean	false
Any object reference (for example, a String)	null

Example

Find biggest element in an array...

```
large= arr[i]
for(i=0; i<arr.length; i++)
{
         if(large<arr[i])
         {
             large=arr[i];
         }
}</pre>
```

Using for-each..

☐ Consider the following array

```
double [] price = { 40, 20, 30 };
```

☐ Using normal for loop

```
for ( int m=0; m<price.length; m++ )
    System.out.println ( price[m] );</pre>
```

Multi Dimension Array...

• 2-D Array

 allow organization of data in rows and columns in a table-like representation.

	Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Week 1	35	28.6	29.3	38	43.1	45.6	49
Week 2	51.9	37.9	34.1	37.1	39	40.5	43.2
* * *							10
Week 51	56.2	51.9	45.3	48.7	42.9	35.5	38.2
Week 52	33.2	27.1	24.9	29.8	37.7	39.9	38.8

Multi Dimension Array...

• 2-D Array

 allow organization of data in rows and columns in a table-like representation.

	Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
Week 1	35	28.6	29.3	38	43.1	45.6	49
Week 2	51.9	37.9	34.1	37.1	39	40.5	43.2
							10

Week 51	56.2	51.9	45.3	48.7	42.9	35.5	38.2
Week 52	33.2	27.1	24.9	29.8	37.7	39.9	38.8

2-Dimension Array

Declaring a 2-dimensional array

An Array of Arrays

```
datatype [][] arrayName;ordatatype [][] arrayName1, arrayName2, ...;
```

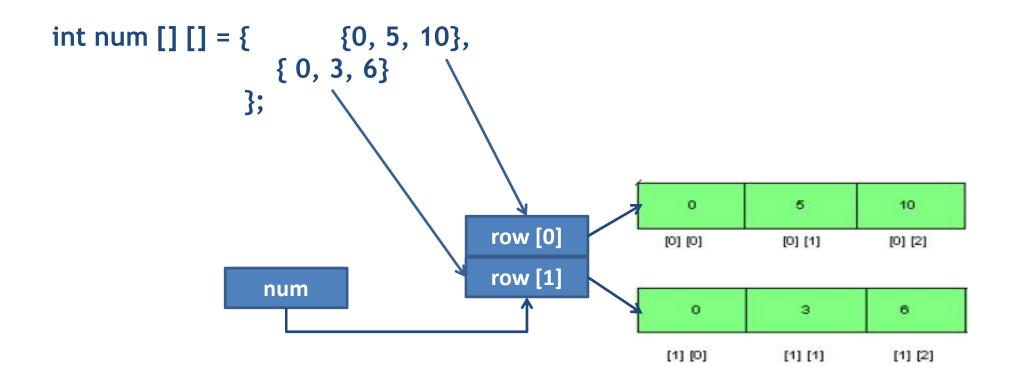

• Instantiating 2-dimensional array: example

```
- int [][] matrix = new int[3][3];
```

- float [][] price = new float[2][4];

Initializing 2-D Array:

An Array of Arrays

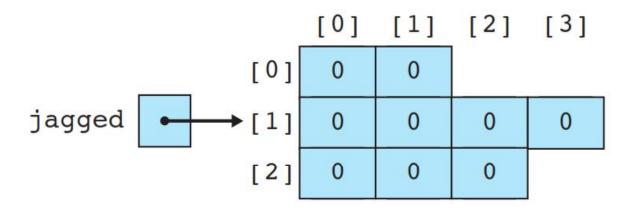

Finding biggest element using for each..

```
class Big {
       public static void main (String [] arg) {
             int [] myArr = { 45, 5, 34, 8 };
             int big = myArr[0];
             for( int num : myArr)
                    if (big<num)
                           big = num;
             System.out.println("Bigest = " + big);
```

Jagged Array...

Consider following structure of array

Each row can have different number of columns

Jagged Array...

Creating jagged array

```
int [][] jagged = new int [3] [];

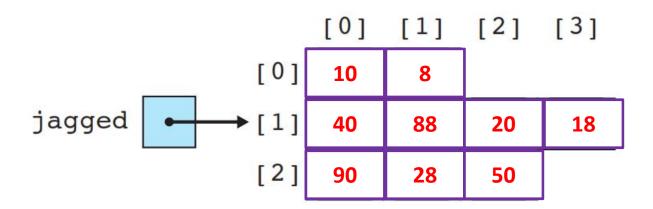

jagged[0] = new int [2];

jagged[1] = new int [4];

jagged[2] = new int [3];
```

Jagged Array...

- Application of Jagged Arrays
 - Pascal's Triangle
- Write a program to initialize jagged array with following values.
- Also find the biggest element in this array.

Finding biggest in jagged array...

```
class CheckEquality {
   public static void main (String [] arg) {
           int [][] jagged = { { 10, 8 }, { 40, 88, 20, 18 }, { 90, 28, 50 }  };
           int big = jagged[0][0];
                    for ( int row = 0; row < jagged.length; row++)
                              for ( int col = 0; col < jagged[row].length; col++)
                                        if ( big < jagged[row][col] )</pre>
                                                   biq = jagged[row][col];
                                                                                       [1]
                                                                                           [2] [3]
            System.out.println("Biggest = " + big);
                                                                 jagged -
```

Bitwise Operators

Converting uppercase ad lowercase using bitwise

```
class Lowercase{
    public static void main(String[] args){
        char ch;
    for(int i= 0; i < 10; i++){
        ch=(char) ('A'+i);
        System.out.println(ch);

    ch = (char) ((int) ch | 32);
        System.out.println(ch + " ");
    }
}</pre>
```

```
Class ArrayDemo{
  public static void main(String [] args){
  int [] arr = new int[10];
  int i;
  for(i=0; i<10; i++){
      arr[i] =i;
      System.out.println("Array contains" +arr[i]);
```

```
class JavaArrayLengthTest
{
    public static void main(String[] args) {
        String[] testArray = { "Apple", "Banana", "Carrots" };
    int arrayLength = testArray.length; System.out.println("The length of the array is: " + arrayLength); } }
```

```
class UpCase {
  public static void main(String args[]) {
    char ch;
    for(int i=0; i < 10; i++)
    {
        ch = (char) ('a' + i);
        System.out.print(ch);
        ch = (char) ((int) ch & 65503);
        System.out.print(ch + " ");
    }
}</pre>
```
